Deep Learning

Artificial Intelligence, deep learning, machine learning — whatever you're doing if you don't understand it—learn it. Because otherwise you're going to be a dinosaur within 3 years.

-Mark Cuban

Contenido y Evaluación

➤ Modulo I → Fundamentos del Deep Learning (DL)

- ¿Qué es Deep Learning?
- Introducción a PyTorch
- Tensores y operaciones básicas
- Álgebra Lineal para Deep Learning (Producto punto y producto matricial)
- Fundamentos de Redes Neuronales: Neurona artificial, Perceptrón, Funciones de activación (ReLU, Sigmoid, Tanh, Softmax), Funciones de pérdida
- Bases de datos: Organización (Train/Validation/Test), Dataset y DataLoader
- Optimización de entrenamiento: Descenso del gradiente, SGD, Adam
- Primer modelo de regresión en PyTorch

Eventos evaluativos

- Parcial I 20% - Semana 4
- Laboratorio I 10% - Semana 5

➤ **Modulo II → Modelos Convolucionales**

- Convolutional Neural Networks (CNN)
- AutoEncoders
- U-Net Neural Networks
- Optimizadores
- Overfitting y underfitting.
- Hiperparámetros
- Grid search vs Random search
- Early stopping
- PCA vs Autoencoders

Eventos evaluativos

- Quiz I 10% - Semana 7
- Laboratorio II 10% - Semana 8

➤ Modulo III → Modelos Generativos y de Atención

- VAE
- GANs y cGANs
- Motivación de la atención
- Atención vs RNN
- Self-Attention Transformers (visión general)
- Encoder–Decoder
- Casos de uso: texto, imágenes, señales
- Limitaciones y costos computacionales

Eventos evaluativos

- Quiz II 10% - Semana 12

➤ **Modulo IV → Modelos Secuenciales**

- Redes Neuronales Recurrentes (Recurrent Neural Networks, RNN)
- Problemas del Desvanecimiento y Explosión del Gradiente (Vanishing and Exploding Gradient Problems)
- Long Short-Term Memory (LSTM)
- Gated Recurrent Unit (GRU)
- Modelado de Series Temporales (Time Series Forecasting)
- Fundamentos del Procesamiento del Lenguaje Natural (Natural Language Processing, NLP)

Eventos evaluativos

- Quiz III 10% - Semana 15
- Laboratorio III 10% - Semana 16

Contenido y Evaluación

➤ Panorama global

Evento Evaluativo	Porcentaje	Semana
Parcial I	20 %	Semana 4
Laboratorio I	10 %	Semana 5
Quiz I	10 %	Semana 7
Laboratorio II	10 %	Semana 8
Quiz II	10 %	Semana 12
Quiz III	10 %	Semana 15
Laboratorio III	10 %	Semana 16
Proyecto Final	20 %	Semana 18

Nota: Los laboratorios y el proyecto final se desarrollarán en grupos de máximo tres estudiantes. Los grupos se conformarán durante la primera clase y se mantendrán **sin cambios** durante todo el semestre.

Reglas generales

➤ Asistencia

La inasistencia se penalizará de la siguiente manera sobre la nota del proyecto final:

Inasistencia de 12 horas: penalización del **20 %**.

Inasistencia de 9 horas: penalización del **10 %**.

Inasistencia de 6 horas: penalización del **5 %**.

Hasta 3 horas de inasistencia: se considerarán como margen de tolerancia y no tendrán penalización.

➤ Compromisos de los estudiantes

Realizar y entregar las actividades en las fechas definidas.

Aportar significativamente al equipo de trabajo.

Estar atento a sus calificaciones durante todo el semestre.

Leer y seguir los lineamientos del reglamento, el cual está disponible en

<https://www.eafit.edu.co/institucional/reglamentos/Documents/reglamento-academico-pregrado.pdf>.

Información Importante

Actividad	Fecha	Observaciones
Inicio y terminación de clases	Julio 13 / Noviembre 07	Del 09 al 21 de noviembre se pueden utilizar para la realización de evaluaciones finales.
Semana de receso	Octubre 05 / Octubre 11	No clases – No eventos evaluativos.
Fecha límite para solicitar la suspensión de semestre	Octubre 02	Consultar regularmente las solicitudes de cancelación.
Fecha límite para reportar 70%	Noviembre 04	En EAFIT Interactiva.
Fecha límite de cancelación de materias	Noviembre 06	Consultar regularmente las solicitudes de cancelación.
Fecha límite para reportar 100%	Noviembre 24	En EAFIT Interactiva.

Framework

En Deep Learning no escribimos programas lineales; trabajamos con un *workflow experimental*
PyTorch proporciona la estructura para definir, entrenar y evaluar modelos de forma iterativa.

- **PyTorch** es un framework de **cómputo científico de código abierto**, basado en Python, diseñado para realizar **operaciones numéricas de alto rendimiento** y para el desarrollo de **modelos de Deep Learning**.
- Es ampliamente utilizado tanto en **investigación** como en **aplicaciones industriales**, debido a su flexibilidad, eficiencia y facilidad de uso.

Público Objetivo

- Usuarios de cómputo numérico: Funciona como un reemplazo de NumPy que permite ejecutar operaciones sobre tensores acelerados por GPU.
- Investigadores y desarrolladores en Deep Learning: Proporciona una plataforma flexible y eficiente para diseñar, entrenar y experimentar con redes neuronales.

¿Qué necesitas para el curso?

➤ Python – IDE

Visual Studio Code

Lightning^{AI}

matplotlib

pandas

seaborn

➤ Python libraries

Pycharm

PyCharm es un Entorno de Desarrollo Integrado (IDE) diseñado específicamente para la programación en Python. Es desarrollado por JetBrains, una empresa reconocida por crear herramientas de desarrollo de software potentes y fáciles de usar. PyCharm ofrece una amplia variedad de funciones para mejorar la experiencia de desarrollo en Python y aumentar la productividad. Algunas de sus características principales incluyen:

- Editor de código
- Análisis inteligente de código
- Debugger (Depurar)
- Gestión de Proyectos

Visual Studio Code

Visual Studio Code es un editor de código fuente multiplataforma, ligero y altamente configurable, utilizado para el desarrollo de software en múltiples lenguajes de programación, incluido Python. Es desarrollado por Microsoft y se destaca por su flexibilidad, rapidez y amplio ecosistema de extensiones. Visual Studio Code ofrece herramientas que facilitan la escritura, depuración y organización del código, permitiendo al desarrollador personalizar el entorno de trabajo según sus necesidades y mejorar su productividad.

D Panel

kaggle

[Link](#)

Kaggle es una plataforma en línea muy popular para competencias de **ciencia de datos y aprendizaje automático**, así como una comunidad para entusiastas y profesionales de los datos. Proporciona un espacio donde individuos y equipos pueden abordar desafíos de datos del mundo real, colaborar en proyectos y mostrar sus habilidades.

<https://www.youtube.com/c/kaggle>

Fuentes – Bases de datos

Lightning

Lightning es un marco de trabajo (framework) de alto nivel para el desarrollo de modelos de aprendizaje profundo en Python, diseñado para simplificar y estandarizar el proceso de entrenamiento de redes neuronales. Construido sobre PyTorch, Lightning abstrae la lógica de entrenamiento, validación y prueba, permitiendo al desarrollador concentrarse en el diseño del modelo y el análisis de resultados. Se caracteriza por su estructura clara, modularidad y escalabilidad, facilitando la escritura de código limpio, reproducible y eficiente, así como la ejecución de experimentos en diferentes dispositivos y arquitecturas de cómputo.

The screenshot shows a code editor with a dark theme. On the left, there is an 'EXPLORER' sidebar showing a file tree for 'THIS_STUDIO [SSH: SSH.LIGHTNING.AI]'. The files listed are: '.lightning_studio', '.triton', 'lit-gpt', 'lit-tiny-llama-1.1b', 'convert_pretrained_checkpoint.py', 'evaluate.py' (selected), and 'pretrain.py'. The main editor area displays the code for 'evaluate.py'. The code includes imports for 'json', 'sys', 'Path', 'Dict', 'List', 'Literal', 'Optional', 'lightning as L', 'torch', 'BitsandbytesPrecision', 'base', 'evaluator', 'tasks', and 'BaseLM'. It also includes a comment about running without installing as a package and a class definition 'EvalHarnessBase(BaseLM)'. The class has an '__init__' method that takes 'fabric', 'model', 'tokenizer', and 'batch_size' as arguments. The status bar at the bottom shows 'Ln 20, Col 29', 'Spaces: 4', 'UTF-8', 'LF', 'Python 3.8.10 64-bit'.

```
1 import json
2 import sys
3 from pathlib import Path
4 from typing import Dict, List, Literal, Optional
5
6 import lightning as L
7 import torch
8 from lightning.fabric.plugins import BitsandbytesPrecision
9 from lm_eval import base, evaluator, tasks
10 from lm_eval.base import BaseLM
11
12 # support running without installing as a package
13 wd = Path(__file__).parent.parent.resolve()
14 sys.path.append(str(wd))
15
16 from generate.base import generate
17 from lit_gpt import GPT, Config, Tokenizer
18 from lit_gpt.utils import (
19     check_valid_checkpoint_dir,
20     get_default_supported_precision,
21     gptq_quantization,
22     load_checkpoint,
23 )
24
25
26 class EvalHarnessBase(BaseLM):
27     # Credits:
28     # https://github.com/EleutherAI/gpt-neox/blob/main/eval_tasks/eval_adapter
29     def __init__(self, fabric: L.Fabric, model: GPT, tokenizer: Tokenizer, bat
30         super().__init__()
31         self.fabric = fabric
32         self.model = model
33         self.tokenizer = tokenizer
```

IMPORTANTE

```
Beautiful is better than ugly.  
Explicit is better than implicit.  
Simple is better than complex.  
Complex is better than complicated.  
Flat is better than nested.  
Sparse is better than dense.  
Readability counts.
```

Listing 2.1: Sample of the Zen of Python.

¿Qué es la inteligencia?

La inteligencia es un concepto complejo que puede definirse como la **capacidad de aprender, comprender, razonar, resolver problemas y adaptarse a nuevas situaciones.**

Implica la habilidad de **percibir información, retenerla como conocimiento y aplicarla de manera efectiva.**

Does intelligence imply knowledge?

Aristotle

Understanding – awareness- be

The intelligence consists not only in the knowledge but also in the skill to apply the knowledge into practice.

Breve Historia y contexto

Aristotle 380 BC
Prior Analytics / syllogistic

Un silogismo es un tipo de razonamiento lógico que consta de dos proposiciones llamadas premisas y una conclusión.

Por ejemplo:

Premisa 1: Todos los seres humanos son mortales.

Premisa 2: Sócrates es humano.

Conclusión: Por lo tanto, Sócrates es mortal.

A QUARTERLY REVIEW

OF

PSYCHOLOGY AND PHILOSOPHY

I.—COMPUTING MACHINERY AND INTELLIGENCE

By A. M. TURING

1. *The Imitation Game.*

I PROPOSE to consider the question 'Can machines think?' This should begin with definitions of the meaning of the terms 'machine' and 'think'. The definitions might be framed so as to reflect so far as possible the normal use of the words, but this attitude is dangerous. If the meaning of the words 'machine' and 'think' are to be found by examining how they are commonly used it is difficult to escape the conclusion that the meaning

'Can machines think?'
the meaning of the terms

ON COMPUTABLE NUMBERS, WITH AN APPLICATION TO
THE ENTSCHEIDUNGSPROBLEM

By A. M. TURING.

[Received 28 May, 1936.—Read 12 November, 1936.]

Is there a universal algorithm that, given any mathematical statement, determines in a finite number of steps whether it is true or false?

Breve Historia y contexto

Kurt Gödel

Incompleteness theorem "Any effectively generated formal system capable of expressing elementary arithmetic cannot be both consistent and complete. In particular, for any such consistent formal system, there will exist statements that are undecidable within the system." 1931

<https://www.youtube.com/shorts/A-GV6LduJNM>

David Hilbert

"**Decision problem**" is related to the question of whether there is an algorithm that can determine whether a given mathematical statement is true or false, 1928.

Entscheidungsproblem

The halting problem is a fundamental question in the theory of computing. The problem refers to the impossibility of determining, by one algorithm, whether another algorithm will stop its execution or enter an infinite loop for any given input. 1936

Halting problem

Breve Historia y contexto

The halting problem is a fundamental question in the theory of computing. The problem refers to the impossibility of determining, by one algorithm, whether another algorithm will stop its execution or enter an infinite loop for any given input. 1936

Halting problem

WALK

Input: x

```
steps = 0
while steps != x:
    move forward
    turn right
    steps = steps + 1
```

HALT

Inputs: program, input

```
if program halts
when given input:
    return yes
else:
    return no
```

Proof by Contradiction

1. Assume there is a program that solves the halting problem.
2. Show that the assumption leads to a contradiction, so the assumption must not be true.

Unsupervised
Machine Learning

Semi-Supervised
Learning

Reinforcement
Learning

Qué es Machine Learning?

Se define por el uso de conjuntos de datos etiquetados para entrenar algoritmos **capaces de clasificar datos o predecir resultados de manera precisa**.

El algoritmo aprende a realizar predicciones o clasificaciones a partir de datos de entrenamiento y puede generalizar su conocimiento para hacer predicciones correctas sobre datos nuevos que no ha visto previamente.

Se denomina “supervisado” porque el proceso de entrenamiento del algoritmo está **guiado y supervisado** por las respuestas correctas conocidas en el conjunto de datos de entrenamiento.

Regression

Classification

Regression

- Linear Regression
- Regression Trees
- Non-Linear Regression
- Bayesian Linear Regression
- Polynomial Regression

Classification

- Random Forest
- Decision Trees
- Logistic Regression
- Support vector Machines

Qué es Machine Learning?

https://www.cs.toronto.edu/~frossard/post/multiple_linear_regression/

¿Cuál es la curva más eficiente que puede explicar la mayor parte de los datos?

¿Cuál es el mejor optimizador para el aproximador?

Qué es Machine Learning?

Requirements:

- No missing values
- Data in numeric format (Hot encoding)
- Data store in array

Pros:

- High Accuracy
- Easy Interpretability
- Data in numeric format (Hot encoding)
- Data store in array

Cons:

- Data Labeling
- Overfitting
- Not Scalability
- Human Intervention
- Data training period is longer, since supervised learning requires a lot of computation time.

Qué es Machine Learning?

En el **aprendizaje automático no supervisado**, al algoritmo se le proporcionan datos de entrada sin ningún objetivo correspondiente o salida etiquetada. El objetivo del algoritmo es descubrir por sí mismo patrones, relaciones o estructuras dentro de los datos. Este enfoque se utiliza para tareas como la agrupación (clustering), que consiste en agrupar puntos de datos similares, y la reducción de dimensionalidad, que busca simplificar los datos preservando la información importante, sin necesidad de supervisión explícita ni de datos etiquetados.

•Clustering

- Clustering
- Association

Qué es Machine Learning?

Supervised Learning

Classification

Unsupervised Learning

Clustering

Clasificación: Predicción de etiquetas basada en características que ya han sido observadas en los datos. Permite encontrar patrones relacionados con la variable objetivo.

Clustering: Utiliza datos históricos no etiquetados para explorar y crear una estructura o forma que permita organizar dichos datos.

Qué es Machine Learning?

Requirements:

- No missing values
- Data in numeric format (Hot encoding)
- Data store in array

Pros:

- Learns and classifies data from no data labeling
- Requires fewer manual data preparation
- No Human Intervention
- Capable of finding previously unknown patterns in data
- Real time analysis

Cons:

- Not Well Accuracy
- Hard to interpret (Users need to manually interpret)
- Difficult to measure accuracy or effectiveness due to lack of predefined answers during training

Qué es Machine Learning?

En el Aprendizaje por Refuerzo, un agente interactúa con su entorno produciendo acciones y descubriendo errores o recompensas. El Aprendizaje por Refuerzo está inspirado en la psicología conductual y consiste en tomar secuencias de decisiones con el objetivo de maximizar una recompensa acumulada.

Qué es Machine Learning?

Input Raw Data

Qué es Machine Learning?

Agente: El aprendiz que interactúa con el entorno. El agente realiza acciones basándose en su estado actual y en sus observaciones.

Entorno: El sistema externo con el que interactúa el agente. El entorno es responsable de proporcionar retroalimentación al agente en forma de recompensas y transiciones de estado.

Estado: Una representación de la situación o configuración actual del entorno. El estado ayuda al agente a comprender su posición y a tomar decisiones.

Acción: Las elecciones o decisiones que toma el agente en cada instante de tiempo. Las acciones se seleccionan a partir de un conjunto de acciones posibles disponibles para el agente en el estado actual.

Recompensa: Un valor escalar que el agente recibe del entorno después de realizar una acción en un estado determinado.

Qué es Machine Learning?

The agent determine by own what information is relevant and how to implement to learn.

<https://www.youtube.com/watch?v=QilHGSYbjDQ&t=17s>

reinforcement learning

Qué es Machine Learning?

Requirements:

- Data in numeric format (Hot encoding)
- Data store in array

Pros:

- Reinforcement learning can be used to solve very complex problems that cannot be solved by conventional techniques
- The model can correct the errors that occurred during the training process
- In the absence of a training dataset, it is bound to learn from its experience
- Capable of finding previously unknown patterns in data
- Real time analysis

Cons:

- Demands a lot of data and a lot of computation.
- Too much of reinforcement may cause an overload which could weaken the results.
